

Fork Positioner for Forklifts

Forklift Fork Positioners - The fork positioner is actually a hydraulic apparatus which can allow the the one driving to be able to maneuver the forklift without leaving the seat. They are constructed out of high quality materials and are intended to endure the most difficult operations and work surroundings. Side shifting models have the added ability to be able to laterally position the entire load or the arms so as to facilitate more precise lifting and placement in a faster and more effective manner.

The fork pocket is somewhat unique and enables the one operating it to be able to securely swing the forks into position without any fear of destroying the positioning cylinders. This allows the driver the option to perform independent or simultaneous fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
